# Chapter 1

## Namespace Index

### 1.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

#### Multiple

Client Server Module Using Multithreading This module consist of Server Code that can handle multiple customers(clients) at the same time for the Shopping Mall based Model . . . . . 5

## Chapter 2

# Class Index

### 2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

[project01.user](#)

Class named User consist of all the Methods that are required for the handling of Clients and all the data calculations required for the suggestions that will be provided to the customer . . . . [7](#)

## Chapter 3

# Namespace Documentation

### 3.1 Multiple Namespace Reference

Client Server Module Using Multithreading This module consist of Server Code that can handle multiple customers(clients) at the same time for the Shopping Mall based Model.

#### 3.1.1 Detailed Description

Client Server Module Using Multithreading This module consist of Server Code that can handle multiple customers(clients) at the same time for the Shopping Mall based Model.

The Customers will be provided with the Interface with which they can select multiple operations and also choose the shop they want to go and by using the current data if any (or will be created) they will be provided with suggestion regarding the next shop they should visit. More details.

## Chapter 4

# Class Documentation

### 4.1 project01.user Class Reference

Class named User consist of all the Methods that are required for the handling of Clients and all the data calculations required for the suggestions that will be provided to the customer.

#### Public Member Functions

- `def __init__ (self, username)`  
*The constructor.*
- `def run (self)`  
*Run Method handle or provide with the Operation List that can be performed in order to choose the shop customer would like to go next or taking suggestions and also see their current path of shops they visited.*
- `def create_data (self)`  
*Create Data generates random data that will be further useful for the suggestion.*
- `def new_user (self, user_name)`  
*New User creates the New User and Save its Name in New User DataBase.*
- `def append_list (self)`  
*Append List let User to choose the next shop that user want to visit and than once User has visited all the shop once it stores it into the DataBase it also let user know that same shop donot get repeated.*
- `def suggestion (self)`  
*Suggestion uses the current user data and compares it within the DataBase and it return suggestion list on the basis of patter matching.*
- `def row_count (self)`  
*Row Count returns the total number of users present in the DataBase.*
- `def data_match (self, customer_data)`  
*Data Match does pattern matching with the exisiting Data Base in order to find the next shop user should visit.*
- `def print_list (self)`  
*Print\_list prints the current list of the shops that user has visited.*
- `def client_handler (self, connection)`  
*client\_handler informs the client that is now connected and furhter start the run process.*
- `def accept_connections (self, ServerSocket)`  
*accept\_connection accepts the connection that is requested by every new client.*
- `def start_server (self, host, port)`  
*start\_server bind the port on which the communication between server and client will take place.*
- `def send_data (self, message)`  
*send\_data will send the data on the connected client.*
- `def receive_data (self)`  
*receive\_data receives the data that is being send by client.*

## Public Attributes

- `name`

### 4.1.1 Detailed Description

Class named User consist of all the Methods that are required for the handling of Clients and all the data calculations required for the suggestions that will be provided to the customer.

More details.

### 4.1.2 Member Function Documentation

#### 4.1.2.1 `accept_connections()`

```
def project01.user.accept_connections (
    self,
    ServerSocket )
```

`accept_connection` accepts the connection that is requested by every new client.

##### Parameters

<i>self</i>	The object pointer.
<i>ServerSocket</i>	The Socket on which request will be initiated

#### 4.1.2.2 `append_list()`

```
def project01.user.append_list (
    self )
```

Append List let User to choose the next shop that user want to visit and than once User has visited all the shop once it stores it into the DataBase it also let user know that same shop donot get repeated.

##### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.3 client\_handler()

```
def project01.user.client_handler (
    self,
    connection )
```

client\_handler informs the client that is now connected and further start the run process.

##### Parameters

<i>self</i>	The object pointer.
<i>connection</i>	The Socket Connection

#### 4.1.2.4 create\_data()

```
def project01.user.create_data (
    self )
```

Create Data generates random data that will be further useful for the suggestion.

##### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.5 data\_match()

```
def project01.user.data_match (
    self,
    customer_data )
```

Data Match does pattern matching with the existing Data Base in order to find the next shop user should visit.

##### Parameters

<i>self</i>	The object pointer.
<i>customer_data</i>	The List of the Existing Customer Data

#### 4.1.2.6 new\_user()

```
def project01.user.new_user (
    self,
    user_name )
```

New User creates the New User and Save its Name in New User DataBase.

#### Parameters

<i>self</i>	The object pointer.
<i>user_name</i>	The Name Entered by User

#### 4.1.2.7 print\_list()

```
def project01.user.print_list (  
    self )
```

Print\_list prints the current list of the shops that user has visited.

#### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.8 receive\_data()

```
def project01.user.receive_data (  
    self )
```

receive\_data receives the data that is being send by client.

#### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.9 row\_count()

```
def project01.user.row_count (  
    self )
```

Row Count returns the total number of users present in the DataBase.

#### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.10 run()

```
def project01.user.run (
    self )
```

Run Method handle or provide with the Operation List that can be performed in order to choose the shop customer would like to go next or taking suggestions and also see their current path of shops they visited.

##### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

#### 4.1.2.11 send\_data()

```
def project01.user.send_data (
    self,
    message )
```

send\_data will send the data on the connected client.

##### Parameters

<i>self</i>	The object pointer.
<i>message</i>	The data to be sent to client.

#### 4.1.2.12 start\_server()

```
def project01.user.start_server (
    self,
    host,
    port )
```

start\_server bind the port on which the communication between server and client will take place.

##### Parameters

<i>self</i>	The object pointer.
<i>host</i>	The Host ID.
<i>port</i>	The Port on which communication will take place.

#### 4.1.2.13 suggestion()

```
def project01.user.suggestion (
    self )
```

Suggestion uses the current user data and compares it within the DataBase and it return suggestion list on the basis of patter matching.

##### Parameters

<i>self</i>	The object pointer.
-------------	---------------------

The documentation for this class was generated from the following file:
